

Retention Copilot: Hoppy plans the visits that save accounts

Four questions: why the rep's trip · what the data really says · how each visit is planned · which data makes it smarter next.

Meet Hoppy, the rep's co-pilot

1 · We focus on the rep's trip, where saves happen

Keeping accounts is the core of the problem, and rep time is its scarcest input

1

1 rep : hundreds of outlets

A rep sees each account only a few times a year. Time, not data, is the bottleneck.

2

The visit is the moment of truth

Saves are decided face to face. A late or unprepared visit is a lost account.

3

So we equip the whole trip

Who to visit, in which order, with which approved offer and what to say — ready 3 days before.

Built to be used on the road. Drive mode shows only the next destination and the task; voice briefings and one-tap navigation keep eyes on the road. Accounts that don't need the car get a Hoppy call or a care note.

2 · Watch the order rhythm, not the complaints

Churn = an active account (≥ 5 orders) places no order in the next 90 days · back-test on 5,088 accounts

We assumed: Unhappy reviewers are the ones who leave.

Data says: Complainers who keep ordering churn less than average (23.7% vs 28.5%). Silent decliners are the danger (37.1%).

We assumed: A low month means risk.

Data says: Only a break from the account's own rhythm matters: $\geq 2 \times$ its usual gap $\rightarrow$ 39% churn.

Tested on months it never saw

Trained to Feb 2018, predicted Jun-Aug: AUC 0.72; top 10% $\rightarrow$ 57% really churned.

The 90-day definition fits today's data. With more data we will map the full paths accounts take to churn, and re-weight monthly.

3 · Who gets a visit, and when Hoppy plans it

Priority = P(churn) × last-12-month spend · only while saveable (last order ≤ 120 days)

Channel	Priority	Rule	#	Action
 Rep visit	P1 · visit now	Top 40 by priority	40	Visit + offer
	P2 · this week	Next 80	80	Visit if on route
 Hoppy, remote	P3 · win-back call	Silent > 120 days	101	AI call + offer
	P4 · care note	Complained, stable orders	197	Note + small gift
	P5 · monitor	Everything else	682	Re-score weekly

 **Route:** P1 always before P2; inside each group nearest-first + 2-opt. Demo day: 42.5 km vs 57.0 km in risk order (~26%).

P4 is the small, inclusive gesture: complainers whose orders are stable get a personal note — not the rep's time.

Planned 3 days ahead so approvals arrive in time

-  T-3 Hoppy proposes visits + best offer per account
-  T-2 Rep confirms; GM-level offers submitted
-  T-1 Manager / GM approvals land
-  Visit Route, 30-sec audio briefing, talk track, log

Approval time: Rep instant · Manager 1 day · GM 2 days

Levels and permissions are simulated in the demo.

3 · Which offer: each option scored alone, best one wins

$$\text{Expected profit} = \text{Revenue at risk} \times \text{Save-lift} \times \text{Margin (35\%)} - \text{Offer cost}$$

Example A01216: spend R\$ 2,541/yr $\times$ churn risk 62% = R\$ 1,575 revenue at risk (same for every option)

Option (pick one)	Offer	① Save-lift	② Revenue kept $1,575 \times \text{①}$	③ Profit kept $\text{②} \times 35\%$	④ Cost	Expected $\text{③} - \text{④}$
Tier 1 • Rep	Service fix + trial case + POS kit	15%	R\$ 236	R\$ 83	– R\$ 25	R\$ 58
Tier 2 • Manager	Bundle or pizza-partner combo; 5% off the next order	30%	R\$ 473	R\$ 166	– R\$ 102	R\$ 63
Tier 3 • GM ★	Co-branded event, cooler, loyalty reward	60%	R\$ 945	R\$ 331	– R\$ 203	R\$ 128

Three alternatives, not a sum

Hoppy compares the rows and recommends one. The rep brings only that offer.

No straight price cuts

Every incentive is tied to the next order, a bundle, a partner brand or brand support.

A model to test, not a promise

Lift, cost and approvals are simulated; we check the model against real results before rollout.

4 · From saving accounts to building loyalty

Input	Today	Data to add	What improves
P(churn)	Order rhythm, frequency, value	Visit logs, outlet type, competitor activity	Fewer false alarms
Gross margin	Assumed 35% flat	Real SKU margins, cost to serve	Profit, not revenue
Save-lift	Assumed 15 / 30 / 45%	Offer history, A/B tests, visit outcomes	Uplift per account × offer
Offer cost	Assumed % of spend	Actual redemption & promo cost	Exact ROI
Lead time	Assumed 0 / 1 / 2 days	Real approval timestamps	Smarter planning window

Saving accounts is one step. Every outcome flows back so we fix the root cause:
